

**IN THE SPECIFICATION**

Please make the following changes:

On page 7, second paragraph,

As shown in FIG. 10B, in the case that the data is being transmitted through a broadcast connected channel from the IRD 2 to the digital monitor apparatus 1, when the DVTR 3 is switched erroneously to the playback mode, transmission of the data from the IRD 2 is stopped, and the data is automatically supplied ~~from~~ from the DVTR 3 to the digital monitor apparatus 1 undesirably.

On page 8, first paragraph,

Furthermore, because transmission of the data from the IRD 2 is automatically stopped and the data is not supplied from the DVTR 3 to the digital monitor apparatus 1, a scene that is to be seen cannot be seen or the information that is to be obtained cannot be obtained ~~undesirably~~ as desired.

On page 9, second paragraph,

Next, the ~~user turn~~ user turns on a power source to the IRD 2 to set the IRD 2 so as to receive a digital broadcast (third step). Then, the user instructs the DVTR 3 so as to record the data to be supplied (fourth step). Through the first step to fourth step, it becomes possible to duplicate the data to be supplied from the IRD 2 as shown in FIG. 4D.
